PROFESSIONAL SUMMARY

Data Analyst with 2+ years in fintech at Razorpay, working in SQL and Python across payments and reconciliation data. Automated SQL reporting that cut 20 hours of manual work monthly and improved payout SLA from 40 to 15 minutes, a 62% gain.

EXPERIENCE

Technical Consultant — Razorpay Software Pvt. Ltd.

Bengaluru, Karnataka | Oct 2025 – Present

- **Data Analysis:** Quantified 91,115 failed payouts worth ~₹70L across 46 merchants by analyzing transaction failure logs during a critical payout outage, driving the P0 declaration and rollback decision.
- **SQL Reporting:** Cut ~20 hours of manual work monthly and improved payout SLA from 40 to 15 minutes (62% faster) by architecting automated SQL reconciliation reports over ~300K monthly transactions across 18 accounts.
- **Python and Data Cleaning:** Recovered 39% of dormant virtual accounts (27 of 70) and flagged 33 low-balance merchants by cleaning balance data and running cohort analysis on ₹10L with Pandas in Jupyter.

Associate Technical Consultant — Razorpay Software Pvt. Ltd.

Bengaluru, Karnataka | Mar 2024 – Sep 2025

- **Log Analysis:** Restored auto-refresh and live dashboard balances for 4,000+ merchant users by diagnosing balance-fetch degradation through service-log and failure-pattern analysis, cutting failure rate and support tickets.
- **SQL Analysis:** Isolated actual exposure of ₹35,498 in a disputed financial case by reconciling payout records against dashboard transactions with SQL queries across production databases, enabling precise settlement.
- **Process Improvement:** Recovered ~₹5L in transaction fees that had gone uncharged by identifying a fee-debit gap and correcting the reporting logic to surface the anomaly and prevent recurrence.

PROJECTS

Loan Portfolio Risk Tiering - ₹167.3M of At-Risk Principal Identified 🔗

Python (Pandas, NumPy), Jupyter, Tableau

UCUCI Bank lacked a way to spot deteriorating segments across 887,379 borrower accounts before defaults surfaced. Executed data cleaning and exploratory data analysis in Python (Pandas, NumPy) across the full record set, with cohort analysis by issue month, then built a four-tab Tableau data visualization tracking Loan Repayment Rate as the headline KPI. Quantified ₹167.3M in at-risk principal, with Grade C-E borrowers at DTI above 30% on 60-month terms driving the highest delinquency, and tiered the book into High, Medium and Low risk to route collections toward the High tier.

Smart-Retry A/B Testing — ₹1.88M in Annual Savings 🔗

Python (Pandas, scikit-learn, XGBoost), Jupyter

Payment failure retries ran on a uniform routing rule across 2,893 merchants and ₹33.8 Cr of GMV, with no evidence the strategy worked. Executed data cleaning and exploratory data analysis on 201,200 payment transactions, addressing duplicates and target leakage, then ran A/B testing of a smart-retry policy alongside five classification models including logistic regression and XGBoost. Cut failure rates from 16.53% to 15.49%, a 1.03pp drop ($p = 3.3e-10$) worth ~₹1.88M annually against ₹1.44 Cr lost to failures; shipped logistic regression at 0.9285 ROC-AUC.

EXPERTISE

Tools/Platforms: Tableau, Jupyter

AI Tools: ChatGPT, Claude

Languages: SQL, Python, NumPy, Pandas

EDUCATION

BNM Institute of Technology — Bengaluru, Karnataka

Bachelor of Engineering in Computer Science and Engineering

Aug 2019 – May 2023

CERTIFICATIONS

Data Analyst Fellowship - Top Fellow — Next Leap 2026
